Hi,

Stefan Borman mentioned that Matt Katzer has a 'wrong' way of understanding what open source means.

When you look at the jmri defs for the gold decoder then you see my personal view of open source ;-)

<variables>

```
<variable label="Primary Address (1-127)" CV="1"
  item="Short Address" default="03"
  comment="Range 1-127">
  <shortAddressVal/>
</variable>
```

```
<variable label="Start Volts (0-255)" CV="2"
  item="Vstart" default="0"
  comment="Range 0-255">
  <decVal min="0" max="255"/>
</variable>
```

The definition for the primary address misses the min and max attribut.
This is not what i expect from a template. Even the dtd part misses incomplete
template defs.
This template is a pain because it misses the defs you find in the zimo template:

```
<variable label="Speed Table" CV="67">
  <speedTableVal>
    <speedTableEntry step="1" value="4"/>
    <speedTableEntry step="2" value="7"/>
    <speedTableEntry step="3" value="10"/>
    <speedTableEntry step="4" value="13"/>
    <speedTableEntry step="5" value="16"/>
    <speedTableEntry step="6" value="20"/>
    <speedTableEntry step="7" value="24"/>
    <speedTableEntry step="8" value="28"/>
    <speedTableEntry step="9" value="32"/>
    <speedTableEntry step="10" value="36"/>
    <speedTableEntry step="11" value="42"/>
    <speedTableEntry step="12" value="48"/>
    <speedTableEntry step="13" value="54"/>
    <speedTableEntry step="14" value="60"/>
    <speedTableEntry step="15" value="68"/>
    <speedTableEntry step="16" value="76"/>
```

```
<speedTableEntry step="17" value="84"/>  
<speedTableEntry step="18" value="92"/>  
<speedTableEntry step="19" value="102"/>  
<speedTableEntry step="20" value="112"/>  
<speedTableEntry step="21" value="124"/>  
<speedTableEntry step="22" value="136"/>  
<speedTableEntry step="23" value="152"/>  
<speedTableEntry step="24" value="168"/>  
<speedTableEntry step="25" value="188"/>  
<speedTableEntry step="26" value="208"/>  
<speedTableEntry step="27" value="230"/>  
<speedTableEntry step="28" value="252"/>  
</speedTableVal>  
</variable>
```

This is missing in the Lenz Gold decoder template - but you will find:

```
<variable label="Speed Table" CV="67">  
  <speedTableVal/>  
</variable>
```

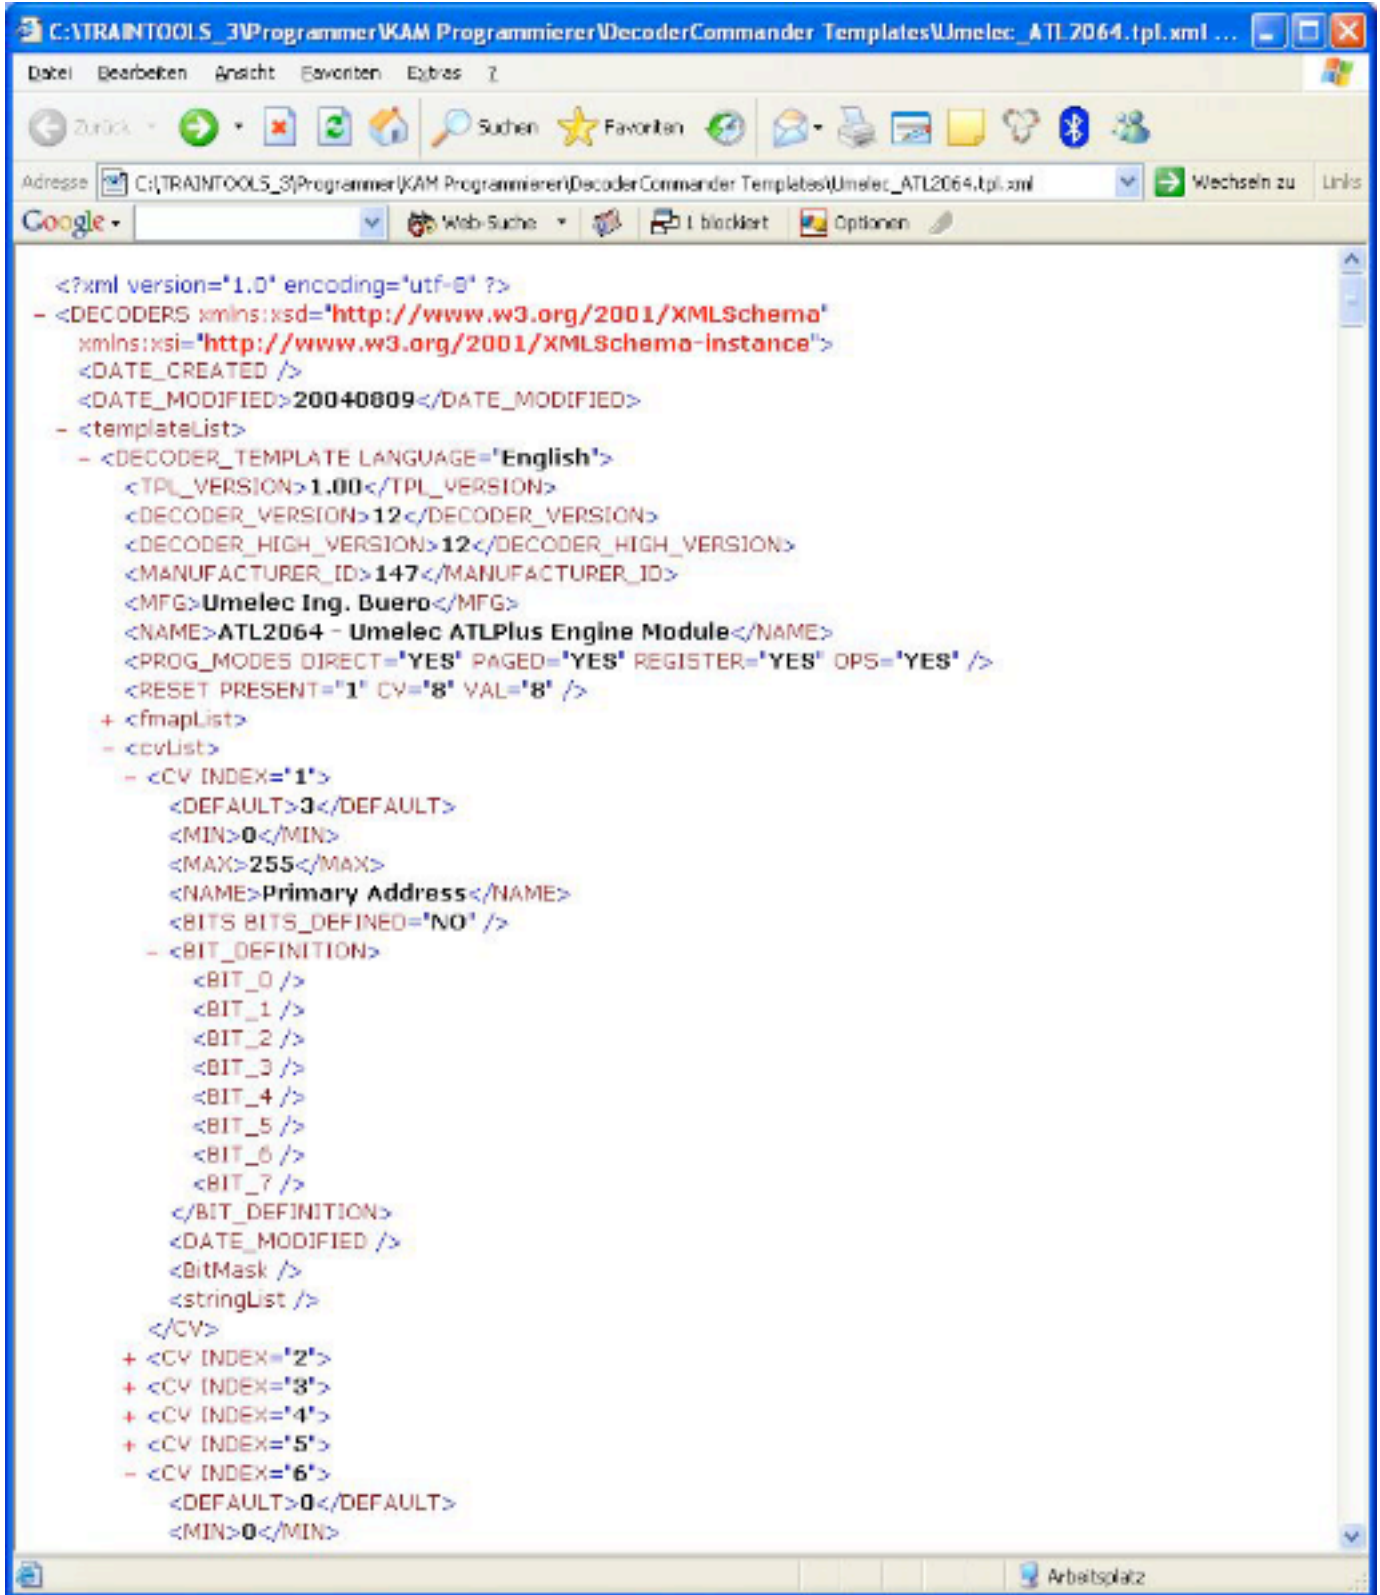

Depending on the person who creates the template - the final results may vary.

it is an approach - but the defs are too lazy to mes.

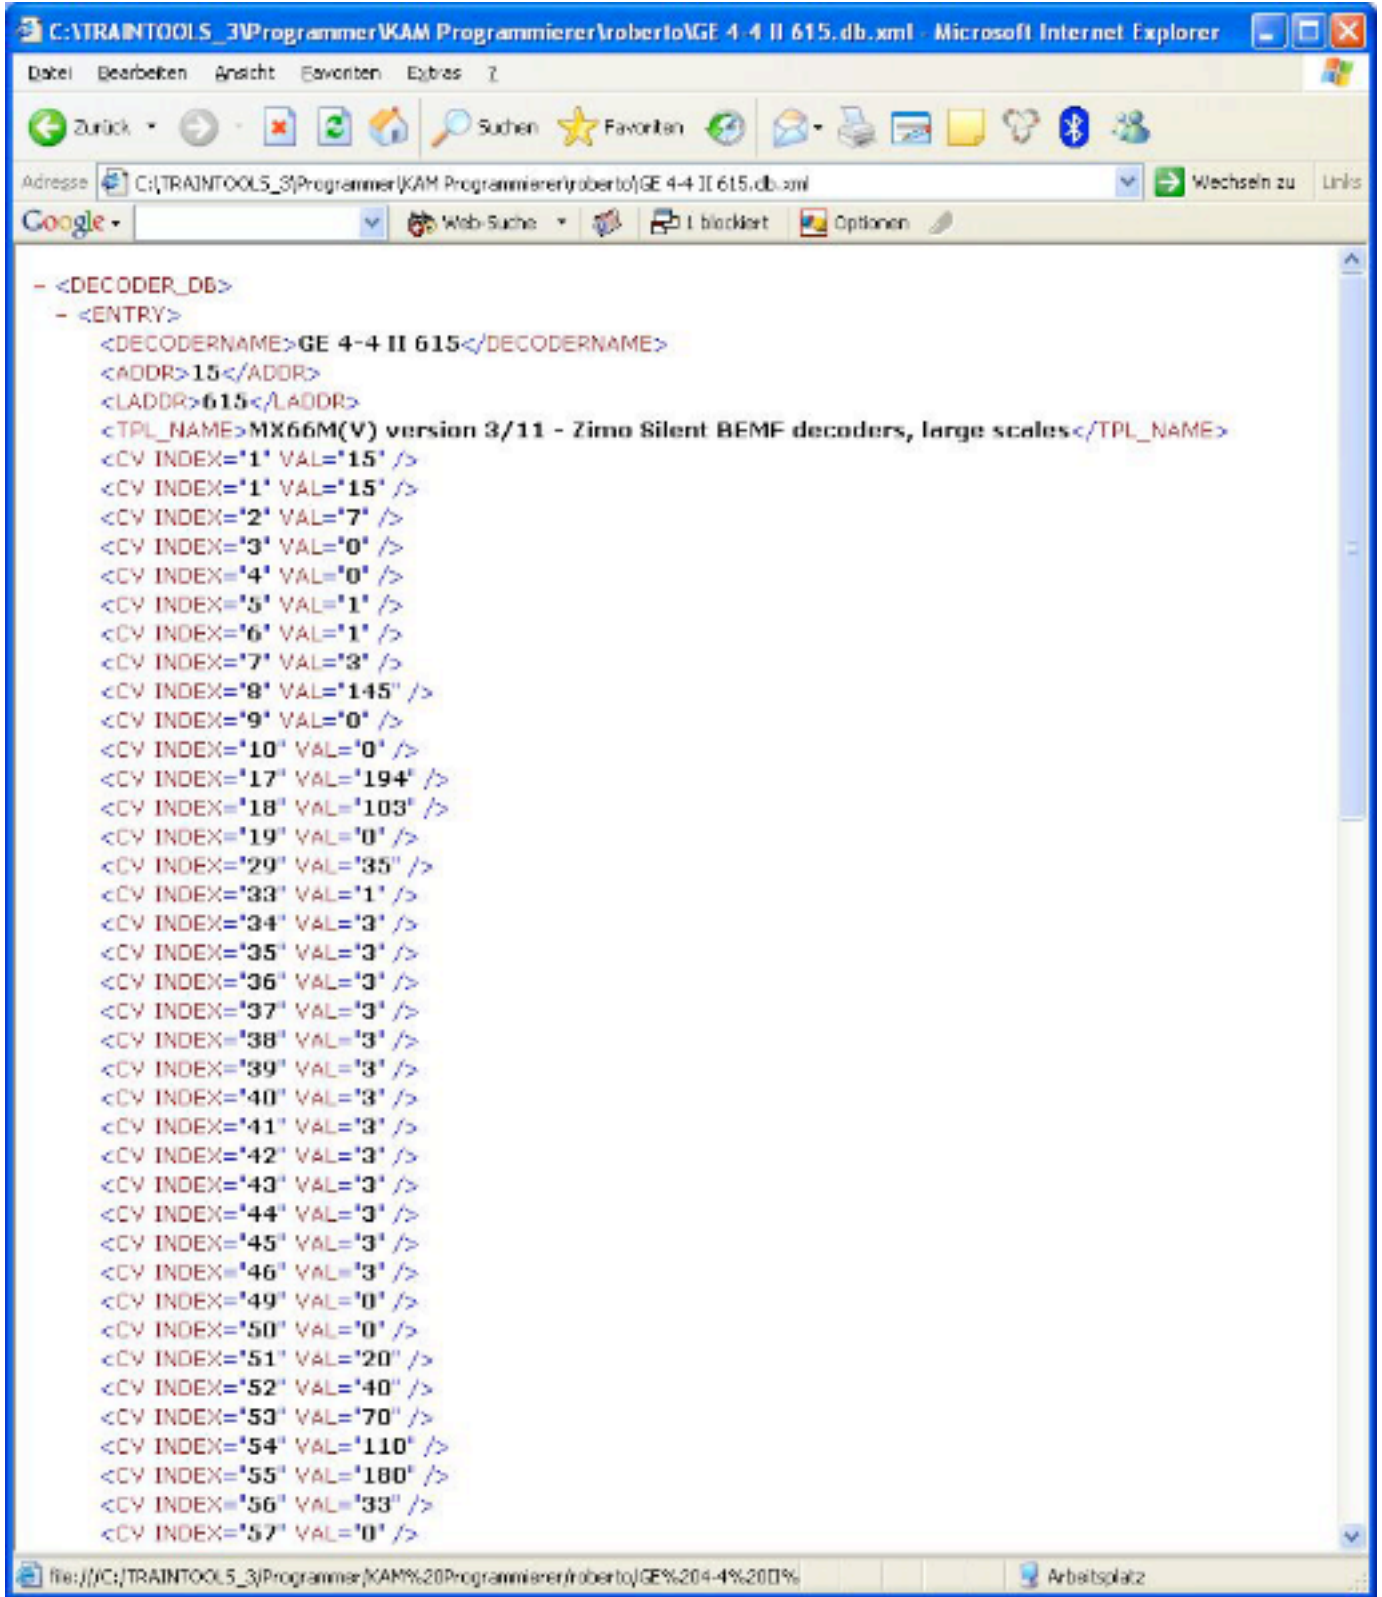

And as Dick already mentioned, the display information should not be part of the decoder template.

This is a manufacturer specific option dealing with the display options.

There are other possibilities:

and saving a specific decoder:

I've written a converter to make jmri templates a bit more strict.
The panel info will also be stripped.
But it need additional work to complete the resulting template...

Robert
